Forward Deployed Engineer | Trase Systems

Cover letter

Hi Trase team,

What caught my eye about Leagues is that the engineer stays with the customer from the first conversation through the production handoff. That’s the part of consulting I like most. The interesting problems usually show up after the demo, when the software has to fit real permissions, uneven data, and the people who have to troubleshoot it.

At Technomancy IT, I own that path for client software. For NuPrice I built and operated the repricing application, from marketplace data and customer-defined rules through billing and support. For Proofmark I worked on a signing flow where identity, document routing, and audit history had to agree. I’ve also built access-controlled connectors for AI and SaaS tools, and supported ML engineers with full-stack and DevOps work on a sensor product. At Front Range Internet, running the NOC taught me to turn what I learned on an escalation into a diagnostic or a procedure someone else could use.

I’d bring that production mindset to agent deployments. For a customer workflow, I’d want to agree on what a successful run looks like and test the awkward cases early: stale input, a denied action, or a decision that needs a person. That’s the kind of work I want to do at Trase, with customers close enough to see whether the system is actually making their day easier.

Thanks,
Chad Koslovsky
